Table: Common Tower Game Mechanics and Their Strategic Value

Mechanic	Description	Strategic Value/ Pro-Tip
Pathing/ Mazing	Forcing enemies to stroll a longer path using positioned towers. Maximizes the "time-under-fire" for your damage dealers. Develop serpentine paths instead of straight lines.	
Targeting Priorities	Setting towers to target the <i>First</i> , <i>Last</i> , <i>Strongest</i> , or <i>Weakest</i> opponent. Avoids overkill on weak minions and guarantees heavy-hitters are focused down early.	
Resource Economy	Generating currency (gold/energy) by means of kills, interest, or devoted farms. Balance investment: costs excessive on defense starves you of development; hoarding gold leads to being overwhelmed.	
Essential Weaknesses	Matching particular damage types (Fire, Ice, Lightning) to opponent armor types. Ice slows fast systems; Fire offers damage-over-time to high-health targets. Make use of these multipliers.	
Active Abilities	International spells (meteor strikes, freezes, reinforcements) with cooldowns. Save these for "boss waves" or emergency situation leaks where standard towers stop working.
