Players position a stake and navigate a grid filled with surprise tiles. Behind these tiles lie either multipliers (gems, coins, or gold) or mines.

The objective is easy: expose as lots of multipliers as possible without clicking on a mine. Each successful click increases the gamer's possible payout, while hitting a mine outcomes in the loss of the current stake. The core appeal of the game lies in the "cash out" mechanic, which permits gamers to protect their winnings at any minute before proceeding to the next tile.

How the Game Mechanics Work

The game depends on a Provably Fair algorithm, guaranteeing that the placement of mines is randomized and proven. When a round starts, the server generates a grid-- normally 5x5-- and distributes an established number of mines throughout it. The gamer then connects with the grid in the list below sequence:

1. **Setting the Parameters:** Before the first click, the player chooses their bet amount and the number of mines they wish to include in the grid (e.g., 1 to 24 mines in a 25-tile grid).
2. **The Reveal:** The gamer clicks a tile. If it is a multiplier, the balance increases, and the gamer can pick to "Cash Out" or continue.
3. **The Risk:** If a mine is activated, the round ends immediately, and the stake is surrendered.
4. **The Multiplier Growth:** The more mines chosen at the start, the greater the multiplier for each effective tile opened.

Comprehending Risk vs. Reward

The table listed below shows how various mine counts impact the potential development of a player's initial stake.

Number of Mines	Multiplier (Tile 1)	Multiplier (Tile 5)	Multiplier (Tile 10)
