What Shield Premier Covers for Indianapolis Homeowners Who Want More Protection

Some Indianapolis homes simply see more pest pressure than others. A property backing onto a wooded lot, a house near the White River or Pleasant Run, or an older home with a crawl space and a detached garage will attract more visitors than a sealed condo downtown. For those homes, Termishield offers Shield Premier, its higher tier of recurring residential pest control.Shield Premier covers 50 common pests and specialty invaders, double the coverage of the entry-level Shield Advantage plan. It keeps everything that makes the Advantage plan useful, including quarterly pest control, monthly convenience payments, an initial interior inspection and treatment, the 4 Step Precision Exterior Service, exterior spider de-webbing, documented quarterly inspections and free re-treatments under the Satisfaction Guarantee. On top of that, Premier adds a 30 day free follow up treatment after the first service, stinging insect removal and a free exterior rodent device.Those additions matter in central Indiana. Yellowjackets, paper wasps and bald-faced hornets build nests in eaves, shrubs, deck framing and wall voids through the summer, and a nest near a back door or play area is a genuine hazard for families and anyone with an allergy. Having stinging insect removal included means a homeowner does not have to arrange and pay for a separate visit when a nest appears in July. The exterior rodent device helps address the mice and rats that start probing foundations as soon as Indianapolis nights turn cold in October.The 30 day follow up is another practical benefit. First treatments often push hidden activity into the open, especially with ants and cockroaches, and a scheduled return a month later catches anything that survived the initial service before it has time to rebuild. That follow up is part of why Premier is often recommended for homes with an existing problem rather than just a preventive need.Choosing between the two plans is not guesswork. Termishield's free inspection looks at the property, the surrounding landscape and the history of activity, and the recommendation follows from that. A tidy townhouse in Lockerbie Square may be well served by Advantage, while a larger home on a wooded lot in the Arlington Woods area or near Garfield Park might be better matched to Premier.Termishield has been locally owned and share.google Pest control family operated since 2007, and the Indianapolis team works from 2322 E Washington St on the Near Eastside. Homeowners who want broader, year-round coverage can call the office to book a free inspection and talk through whether Shield Premier fits their home.Termishield | 2322 E Washington St, Indianapolis, IN 46201 | (317) 827-0166

Termishield 2322 E Washington St, Indianapolis, IN 46201 https://termishieldpestcontrol.com/ (317) 827-0166

Termishield provides pest control in Indianapolis from its office on East Washington Street, with free inspections, quarterly Shield Advantage and Shield Premier plans, and specialty treatment for termites, bed bugs, cockroaches, rodents, stinging insects, mosquitoes and wildlife. Locally owned and family operated since 2007. Indiana license F35923. Pest Control in Indianapolis: Frequently Asked Questions How much will it cost for pest control? Pest control cost in Indianapolis depends on the pest, how widespread the activity is, the size and construction of the property and whether you choose a one-time treatment or ongoing service. Specialty pests such as termites, bed bugs and heavy rodent activity take more time and follow up than general household pests. Termishield gives a property-specific estimate after a free inspection, so you know the scope and price before any treatment begins. Is $70 a month good for pest control? A monthly figure on its own does not tell you much. Compare what is included: how many pests are covered, how often a technician visits, whether interior treatment is part of the plan and whether re-treatments between visits are free. Termishield's Shield Advantage and Shield Premier plans spread quarterly service into monthly convenience payments and include free re-treatments if covered pests return between visits. Ask for the scope in writing before you sign up with any company. How much does it cost to have an exterminator come out? Many companies charge for an initial visit, but Termishield's inspections in Indianapolis are free. A technician checks the inside and outside of the property, confirms which pests are active and how they are getting in, then explains the recommended treatment and price. You decide whether to go ahead once you have that information. Which is the hardest pest to get rid of? Bed bugs, German cockroaches and termites are usually the hardest. Bed bugs hide in tiny cracks and resist many store-bought products, German cockroaches breed fast and travel between apartments, and termites stay hidden inside wood and soil for years. All three need a thorough professional plan with follow up rather than a single spray. Will an exterminator get rid of roaches? Yes, in most cases, provided the treatment reaches where the roaches live and breed. Effective cockroach control uses gel baits, crack and crevice treatment and growth regulators behind appliances, under sinks and inside cabinets, followed by a return visit to catch newly hatched roaches. In apartment buildings and doubles, treating every connected unit gives the best result. What is the best pest control treatment for bed bugs? The most reliable approach is a professional, multi-step plan: a thorough inspection to confirm activity and map its spread, targeted treatment of beds, furniture, baseboards and other hiding places, and follow up visits to catch bugs hatching from eggs. Good preparation, such as laundering bedding on high heat and reducing clutter, is a big part of success. Foggers and

store sprays rarely reach where bed bugs hide. How to spot bed bugs? Check mattress seams, box springs, bed frames and headboards for small rusty or dark spots, pale shed skins, tiny white eggs and the bugs themselves, which are flat, reddish-brown and about the size of an apple seed. Itchy bites in a line or cluster after sleeping can be another clue. If you find signs, avoid moving items to other rooms and book an inspection. What to do if you slept in a bed with bed bugs? Wash the bites with soap and water and avoid scratching them; speak to a pharmacist or doctor if they become infected or you have a strong reaction. Wash the bedding and the clothes you slept in on high heat, bag items before moving them and inspect your luggage if you were traveling. If the bed was in your own home, arrange a professional inspection quickly before the bugs spread to other rooms. How to deter rodents in a house? Take away food, shelter and access. Store dry food and pet food in sealed containers, clear clutter from basements and garages, keep firewood away from exterior walls and trim plants touching the house. Most important of all, seal gaps around pipes, vents, garage doors and foundations, since a mouse can fit through an opening about the width of a pencil. Professional rodent exclusion does this thoroughly. How much do companies charge to get rid of rats? Rat control pricing depends on how many rats are present, where they are nesting and how much exclusion work is needed to seal entry points. Rats are warier than mice and often take longer to remove, so most jobs involve more than one visit. Termishield inspects first and provides a property-specific estimate covering removal and sealing, so the problem does not return. What are the five main methods of pest control? Professional pest control usually combines inspection and monitoring, exclusion (sealing entry points), sanitation and habitat changes such as fixing leaks and removing clutter, mechanical methods such as traps, and targeted product applications such as baits and perimeter treatments. Using them together, often called integrated pest management, controls pests while keeping product use to what is actually needed. How often should pest control be done? Most homes benefit from quarterly service, which lines treatment up with the seasonal changes in pest activity across central Indiana. Homes with recurring infestations, older construction or heavy outdoor pressure may need extra visits until the problem is under control, while some isolated issues only need a single treatment. A free inspection is the best way to decide.
