The clinician should likewise check body mass index in time, as weight gain and main excessive weight are both danger factors for skin tags and metabolic derangements. Skin flexibility-- the ability of skin to stretch and go back to its initial shape-- lowers normally with age and exposure to aspects like UV light. At Wendell Household Medicine, our clinicians see how these changes add to skin tag development. When skin sheds flexibility, it becomes a lot more susceptible to subtle rips and micro-stress in locations of repeated movement or rubbing. Gradually, this can urge tiny flaps of skin to extend and develop skin tags. Lowered flexibility makes it much easier for tiny sections of skin to "bunch up" and remain elevated rather than breaking back into place smoothly.
