At very first look, Rock Paper Scissors appears to be a game of pure luck. Mathematically, however, it is a zero-sum game governed by Game Theory-- specifically, the **Nash Equilibrium**.

According to video game theory, the optimal method for a completely random, unsurpassable game is to play each alternative (Rock, Paper, Scissors) with a **33.3% frequency**, chosen at random. If a gamer adheres strictly to this random circulation, challengers can not exploit them over the long term.

Hand Sign Optimal Frequency Weak Against Strong Against **Rock** 33.3% Paper Scissors **Paper** 33.3% Scissors Rock **Scissors** 33.3% Rock Paper

Nevertheless, human beings are notoriously bad at being really random. This human element is exactly what bettors make use of to acquire an edge.

- **The Loser's Shift:** When players lose, they seldom throw the same indication a third time. Rather, they normally shift to the sign that *would have beaten* what just defeated them. For example, if a player loses with *Scissors* to *Rock*, they will likely throw *Paper* next.
- **The "Rock" Bias:** In the lack of idea, untrained gamers throw *Rock* more regularly than Paper or Scissors since the hand begins in a clenched fist position, making it a subconscious default.
- **The Gambler's Fallacy:** If a player throws *Paper* three times in a row, challengers typically presume they are "due" to throw something else, causing predictable counter-moves.
